

Library Management System - Enhancement Summary

Prepared for: Ratna Sri Lekha Bonagiri

1. Missing 'Category' Column in Books Table

- Issue: The 'Category' column was omitted during implementation.
- Action:
 - * Add 'Category' column to the Books table via migration or SQL ALTER TABLE.
 - * Update Book model class and DTOs to include 'Category'.
 - * Update Angular forms and views to support 'Category' input and display.

2. Tailoring UI for Librarian Role

- Requirement: Librarians should only see libraries assigned to them.
- Action:
 - * Extend AuthUser model to include a relationship with assigned libraries.
 - * Create a join table (e.g., LibrarianLibraries) with UserId and LibraryId.
 - * Add API endpoint to fetch libraries assigned to the logged-in librarian.
 - * In Angular, fetch user role and ID after login and call the new endpoint.
 - * Use AuthGuard to restrict access based on role.

3. Category-Based Filtering in UI

- Requirement: Users should be able to filter books by category.
- Action:
 - * Add a dropdown or search filter for 'Category' in BookComponent.
 - * Implement API endpoint to fetch books by category.

* Update Angular service and component to support category filtering.

Conclusion

These enhancements align with the original problem statement and can be implemented incrementally without rewriting the entire codebase.
